The total TB mortality in 2012 was the highest in the Svobodensky district and amounted to 109.6, in Progress - 69.2, in Bureysky district - 60.1 cases 100 percent thousand people. In 2013 the greatest number of deaths from tuberculosis was registered in Raichikhinsk - 75.8, in the Ivanovo region - 52.0, in the Romny region - 45.5 cases 100 percent thousand of the population. In 2014, Ivanovo region - 51.8, in the Bureysky district - 48.9, in the Oktyabrsky district - 42.1 cases 100 percent thousand of the population. In 2015, the greatest number of deaths from tuberculosis was registered in the Shimanovsky district - 56.6, in the Svobodensky district - 47.9, in the Romny region - 46.0 cases 100 percent thousand of the population. In 2016 in the Mikhailovsky district - 71.4, in Raichikhinsk - 53.4, in the Bureysky district - 28.3 cases 100 percent thousand of the population.

Most people with tuberculosis are aged 18-44 years. The maximum incidence of tuberculosis is 25-34 years for women and 35-44 years for men. The peak of mortality from tuberculosis is at the age of 35-44 years among women and 45-54 among men.

Conclusions. In the Amur Region, there is a stabilization of the epidemic situation of tuberculosis with a tendency to decrease. The reduction of tuberculosis incidence and mortality from this disease occurs against the background of increased coverage of the population with preventive examinations for tuberculosis, development and implementation of modern clinical protocols, procedures and standards of medical care that take international experience into account and reduce the proportion of advanced forms of tuberculosis among newly diagnosed tuberculosis patients.

DIFFICULTIES OF DIFFERENTIAL DIAGNOSTICS OF INTERSTITIAL LUNGS DISEASES
Kostrova I.V., Prikhodko O.B.
Amur state medical academy, Blagoveshchensk, Russian Federation

Abstracts. The hardest problem in practice of general practitioner and pulmonologist is the problem of differential diagnostics of interstitial lungs diseases. We introduce the case of cryptogenic organizing pneumonia with ways of diagnostics and treatment of that disease.

Key words: interstitial lungs diseases, differential diagnostics, cryptogenic organizing pneumonia.

The hardest problem in practice of general practitioner and pulmonologist is the problem of differential diagnostics of interstitial lungs diseases. The traditional triad of the most common causes of pulmonary infiltrates during over many years is the classical differential series. However, with the advent of modern diagnostic methods, diseases that have previously occurred under the guise of those listed above or have not been diagnosed at all, have become plural. There are big difficulties, when radiologist or morphologist meet cases that they have not seen before in their practice. In this case even obtaining a complete histological material does not guarantee a correct diagnosis.

Material and methods. The clinical analysis of the case of a 54-year-old patient was done. During the examination, one of the forms of idiopathic interstitial pneumonia was diagnosed – the cryptogenic organizing pneumonia. The patient came to the department at 08.07 with complaints of fever to subfebrile digits, shortness of breath with moderate physical exertion. From an anamnesis: she considers herself ill since June 14, when she noted a chill after a hypothermia, the temperature was raised to 38°C, she was treated symptomatically, 24.06 a segmental pneumonia in the lower lobe on
APPLICATION PHYTOADAPTOGENS FOR THE CORRECTION OF PHYSICAL LOADS ON THE BODY UNDER TEMPERATURE STRESS
